

Knee Replacement in Nagpur Advanced Care at Ortho Relief Hospital

Restoring mobility, relieving pain, and transforming lives with world-class orthopaedic expertise and robotic precision — right here in Nagpur.

Understanding Knee Replacement Surgery

When knee-damage from arthritis, injury, or wear causes chronic pain and limited mobility, knee replacement surgery offers lasting relief by replacing damaged joint surfaces with artificial implants.

Chronic Pain

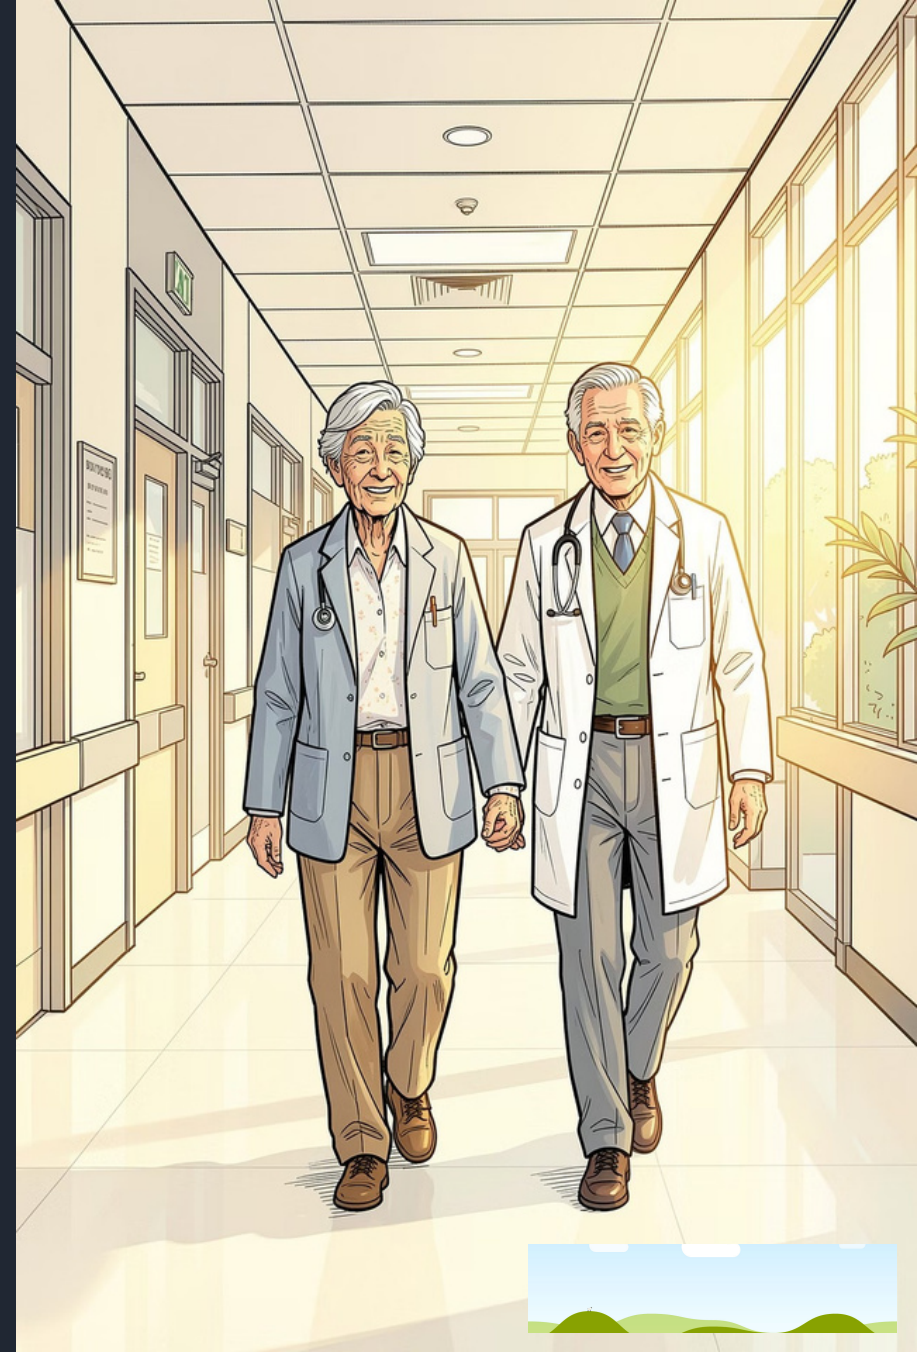

Persistent discomfort that limits daily activities and disrupts sleep

Lost Mobility

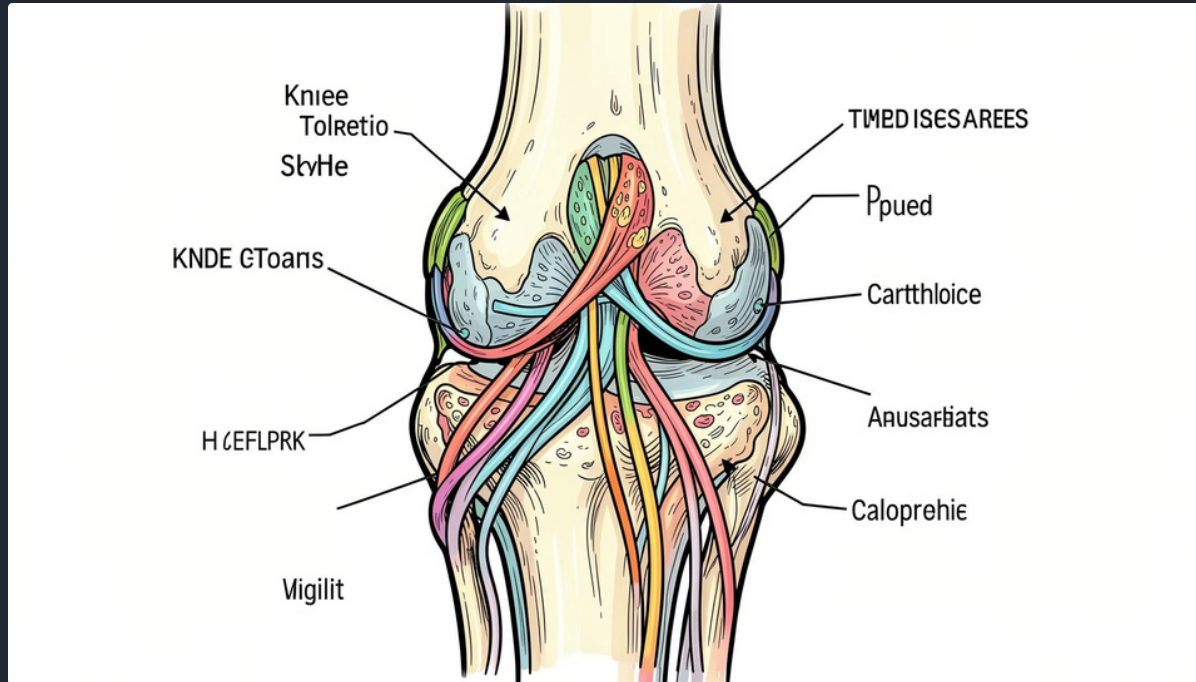

Difficulty walking, climbing stairs, or standing for long periods

Lasting Relief

Timely treatment restores function and dramatically improves quality of life

What is Knee Replacement Surgery?

Two Primary Types

Common causes: Osteoarthritis, rheumatoid arthritis, post-traumatic arthritis, and severe fractures. Ideal candidates experience persistent pain unresponsive to conservative treatments.

Total Knee Replacement

The- entire kneejoint surface-is-replaced — ideal for advanced arthritisor wide-spread-damage.

Partial Knee Replacement

Only-the damaged-compartmentis-replaced — suitable when-damage-is-localized.

Robotic Knee Replacement in Nagpur

ADVANCED TECHNOLOGY

Ortho Relief Hospital leads Nagpur in robotic knee replacement, using computer-guided systems for millimetre-level precision.

How It Works

A 3D model of your knee guides the robot during surgery for personalised alignment.

Superior Precision

Accurate implant positioning reduces complications and extends implant longevity.

Faster Recovery

Minimally invasive technique means less tissue damage, reduced pain, and quicker rehabilitation.

Reduced Risk

Lower blood loss and reduced infection risk compared to conventional surgery.

Signs You May Need Knee Replacement

If conservative treatments no longer help, it may be time to consider knee replacement surgery in Nagpur.

- **Persistent Knee Pain**
Pain that continues at rest or disrupts sleep
- **Difficulty Walking or Climbing Stairs**
Struggling with everyday movements
- **Joint Stiffness & Swelling**
Chronic inflammation that limits range of motion
- **Reduced Mobility**
Inability to perform daily activities independently
- **Failure of Conservative Treatments**
Medications, injections, and therapy no longer provide relief
